AB - J74040877 Method comprises prepg. a fabric reinforcement contg. a number of warps composed of rovings of synthetic fibre or another suitable matl. and a number of wefts composed of prepreg. glass rovings formed by impregnating glass filament bundles with a thermosetting polymer, embedding the fabric reinforcement in the rubber layer of a conveyer belt, and curing the rubber layer while effecting complete curing of the partially cured thermosetting polymer impregnated in the wefts as well as firm bonding of the fabric reinforcement with the rubber layer. Vibrations in the vertical direction are eliminated.
